UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS General Certificate of Education Advanced Subsidiary Level and Advanced Level

CHEMISTRY 9701/04

Paper 4 Structured Questions A2 Core

May/June 2006

1 hour 15 minutes

Candidates answer on the Question Paper. Additional Materials: Data Booklet

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen in the spaces provided on the Question Paper.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

Answer all questions.

You may lose marks if you do not show your working or if you do not use appropriate units.

A Data Booklet is provided.

You may use a calculator.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

International Examinations

Answer all the questions in the spaces provided.

1 The oxidation of nitrogen monoxide occurs readily according to the following equation.

$$NO(g) + \frac{1}{2}O_2(g) \longrightarrow NO_2(g)$$

The following table shows how the initial rate of this reaction depends on the concentrations of the two reactants.

[NO] / mol dm ⁻³	${\rm [O_2]}$ / ${\rm moldm^{-3}}$	initial rate / mol dm ⁻³ s ⁻¹
0.0050	0.0050	0.02
0.0050	0.0075	0.03
0.010	0.0075	0.12

(a)	(i)) Use the data to determine the order of reaction with respect to reagents.	each o	f the
		order with respect to NO		
		order with respect to O ₂		
	(ii)	Write the rate equation for the reaction, and use it to calculate a val constant, <i>k</i> , stating its units.	ue for the	e rate
		rate equation		
	(iii)	numerical value of $k=$	eaction v	when
				[6]

(b)	Nitrogen monoxide plays an important catalytic role in the oxidation of atmospheric SO_2 in the formation of acid rain.					
	(i)	State the type of catalysis shown in this process.				
	(ii)	Explain the steps involved in this process by writing equations for the reactions that occur.				
		[3]				
		[Total: 9]				

2 Monuments made of marble or limestone, such as the Taj Mahal in India and the Mayan temples in Mexico, are suffering erosion by acid rain. The carbonate stone is converted by the acid rain into the relatively more soluble sulphate.

$${\rm CaCO_3(s)} + {\rm H_2SO_4(aq)} \rightarrow {\rm CaSO_4(s)} + {\rm H_2O(l)} + {\rm CO_2(g)}$$
 acid rain

- (i) Write an expression for the solubility product, K_{sp}, of CaSO₄, stating its units.
 (ii) The K_{sp} of CaSO₄ has a numerical value of 3 x 10⁻⁵. Use your expression in (i) to calculate [CaSO₄] in a saturated solution.
 (iii) Hence calculate the maximum loss in mass of a small statue if 100 dm³ of acid rain falls on it. Assume the statue is made of pure calcium carbonate, and that the acid rain becomes saturated with CaSO₄.
- **(b)** The life of such monuments is now being extended by treating them with a mixture of urea and barium hydroxide solutions. After soaking into the pores of the carbonate rock, the urea gradually decomposes to ammonia and carbon dioxide. The carbon dioxide then reacts with the barium hydroxide to form barium carbonate.

$$(NH_2)_2CO(aq) + H_2O(I) \longrightarrow 2NH_3(g) + CO_2(g)$$

$$\mathsf{Ba}(\mathsf{OH})_2(\mathsf{aq}) \ + \ \mathsf{CO}_2(\mathsf{g}) \ \longrightarrow \ \mathsf{Ba}\mathsf{CO}_3(\mathsf{s}) \ + \ \mathsf{H}_2\mathsf{O}(\mathsf{I})$$

Acid rain then converts the barium carbonate to its sulphate.

$$\mathsf{BaCO}_3(\mathsf{s}) \ + \ \mathsf{H}_2\mathsf{SO}_4(\mathsf{aq}) \ \longrightarrow \ \mathsf{BaSO}_4(\mathsf{s}) \ + \ \mathsf{H}_2\mathsf{O}(\mathsf{I}) \ + \ \mathsf{CO}_2(\mathsf{g})$$

Barium sulphate is much less soluble than calcium sulphate. A saturated solution contains $[Ba^{2+}] = 9.0 \times 10^{-6} \,\text{mol dm}^{-3}$.

(i)	Explain why barium sulphate is less soluble than calcium sulphate.

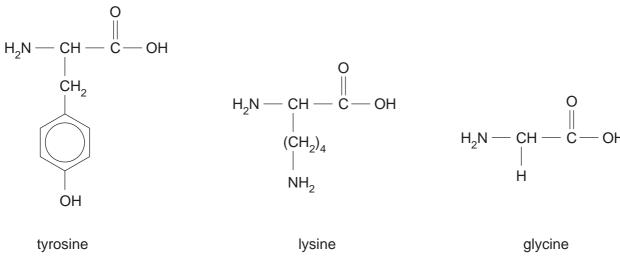

(ii)	Write an expression for the $K_{\rm sp}$ of barium sulphate and use the data to calculate its value.
	[4]
(c) (i)	Explain what is meant by the term lattice energy.
(ii)	Predict, with a reason, how the lattice energy of ${\rm BaSO_4}$ might compare with that of ${\rm MgSO_4}.$

A tra	ransition element X has the electronic configuration [Ar] 4s ² 3d ³ .					
(i)	Predict its likely oxidation states.					
(ii)	State the electronic configuration of the ion \mathbf{X}^{3+} .					
	[2]					
Pota	assium manganate(VII), KMnO ₄ , is a useful oxidising agent in titrimetric analysis.					
(i)	Describe how you could use a $0.0200\mathrm{moldm^{-3}}$ solution of $\mathrm{KMnO_4}$ to determine accurately the [Fe ²⁺] in a solution. Include in your description how you would recognise the end-point in the titration, and write an equation for the titration reaction.					
(ii)	A 2.00 g sample of iron ore was dissolved in dilute $\rm H_2SO_4$ and all the iron in the salts produced was reduced to $\rm Fe^{2+}(aq)$. The solution was made up to a total volume of 100 cm ³ .					
	A 25.0 cm 3 portion of the solution required 14.0 cm 3 of 0.0200 mol dm $^{-3}$ KMnO $_4$ to reach the end-point.					
	Calculate the percentage of iron in the ore.					
	[8]					
	(i) Pota (i)					

digh-strength low-alloy (HSLA) steels are used to fabricate TV masts and long spain oridges. They contain very low amounts of phosphorus and sulphur, but about 1% copper, to improve resistance to atmospheric corrosion. When dissolved in nitric acid, attached this steel gives a pale blue solution.	osphorus and sulphur,	osphorus and	unts of ph spheric co	low amo e to atmo	ntain very resistance	. 4 The amino acids tyrosine, lysine and glycine are constituents of many proteins.

(a) State the reagents and conditions you could use to break proteins down into amino acids.

[2]

- **(b)** Draw a ring around each chiral centre in the above molecules. [1]
- (c) In aqueous solution amino acids exist as zwitterions. Draw the zwitterionic structure of glycine.

.....[1]

- (d) For each of the following reactions, draw the structure of the organic compound formed.
 - (i) glycine + excess NaOH(aq)

(ii) tyrosine + excess NaOH(aq)

[5]

(iii)	lysine + excess HCl(aq)
` '	•
(iv)	tyrosine + excess Br ₂ (aq)

(e) Draw the structural formula of a tripeptide formed from **all three** of these amino acids, showing clearly the peptide bonds.

 21
 1

(f) The formula of part of the chain of a synthetic polyamide is shown below.

$$- \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CO} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{CH_2} - \mathsf{NH} - \mathsf{CH_2} - \mathsf{CH_2}$$

- (i) Identify the repeat unit of the polymer by drawing square brackets around it on the above formula.
- (ii) Draw the structures of the **two** monomers from which the polymer could be made.

[3]

[Total: 14]

5 Benzocaine is an important local anaesthetic used in skin creams for sprains and other muscular pains. It can be made by the following route.

benzocaine

(a) Suggest reagents and conditions for each of the above four reactions.

I	
П	
Ш	
IV	[6]

(b) Draw steps to show the mechanism of reaction I.

[2]

(c) Another local anaesthetic is amylocaine, which can be made from compound ${\bf X}.$

(i) Apart from the benzene ring, name two functional groups in the molecule of compound ${\bf X}$.

(ii)	Explain whether compound X would be more or less basic than benzocaine.
